

ALPACA AI TRADING AGENTS HACKATHON · 2026

Capitol Desk

An autonomous options desk that reads congressional financial disclosures, decides whether the signal is still alive, and trades it — end to end, unattended.

capitol-desk.onrender.com · Claude Opus 5 · Alpaca MCP Server · Alpaca Trading API

Congress trades. The law says they must tell us.

The STOCK Act requires every member of Congress to publicly disclose any transaction over \$1,000 — within 45 days. Those filings are free, public, and almost unreadable.

368

Periodic Transaction Reports filed in 2026

31.5 days

Median lag from trade to disclosure

12%

Filed as scanned paper — zero machine-readable text

Public filings. Trading on them is not insider trading — it is the opposite: acting on information the law requires be published.

- Our answer:** Claude reads the text layer where one exists, and reads the **page visually** where one doesn't. On that 274-row scan it extracted every transaction — and correctly ignored the example row.

(This page will be publicly disclosed)

Six stages, and the model only touches two

INGEST

House Clerk bulk archive → XML index → PTR PDFs, cached and incremental.

CODE

EXTRACT

Text layer where it exists; the page read visually where it doesn't.

CLAUDE

RESOLVE

Name → ticker, then verified against Alpaca before it can trade.

CLAUDE + CODE

DECIDE

Live chains, greeks and signal decay → one contract and a conviction.

CLAUDE

SIZE & GATE

Conviction → contracts, bounded by hard caps. Pure arithmetic.

CODE

EXECUTE

Marketable limit orders and spreads via Alpaca; state reconciled back.

CODE

Claude decides *what* to trade. Code decides *how much*.

Position sizing and risk limits are plain arithmetic in a config file and a gate function. There is no prompt a model can write that gets it a bigger position.

A real filing, a real order

		FILING STATUS: New DESCRIPTION: Purchased 5,000 shares.					

WHAT THE FILING SAYS

Pelosi, filed 21 Aug. Bloom Energy calls, **\$100 strike, expiring 17 Jun 2027** — a deep in-the-money LEAP used as stock replacement.

WHAT THE DESK FOUND

BE had already run **+13.9%** since her trade date. The outright June-2027 contract now costs **\$8,116** against a **\$5,000** per-trade cap — and every affordable strike was 100% time value at 88% implied vol: **volatility risk the filer never took.**

WHAT IT DID

Built a vertical debit spread — long the 175 call (delta 0.75), short the 230. Same expiry, same thesis, **\$2,071 of risk instead of \$8,116**. Conviction cut to 0.45 because the move had partly happened.

It declines far more than it takes

DECLINED ON THE MERITS — VERBATIM

PG — "a \$1k–\$15k purchase inside a 401(k) subholding of a family trust: a routine retirement-account allocation into a mega-cap consumer staple, not an informed, concentrated bet ... there's no thesis to express."

AMAT — "the quote set is internally incoherent: every listed call is priced above the maximum theoretical value of a call ... there is no way to size or price an honest replication." (It had caught a bug in our own price feed.)

Anyone can build a bot that copies Pelosi. The engineering is in the 635 it refused.

WE MEASURED IT

Copying Congress indiscriminately does not work

Event study over 143 filings and 826 disclosed purchases. Entry is the **filing** date, not the transaction date — a trade is private for up to 45 days, so entering earlier is lookahead bias. Returns are excess over SPY across the identical window.

HORIZON	EVENTS	MEAN EXCESS	MEDIAN EXCESS	HIT RATE
5 trading days	799	+0.09%	−0.40%	45.2%
21 trading days	669	+0.74%	−0.37%	49.0%
63 trading days	668	+0.42%	+0.08%	50.1%

Hit rates are a coin flip and the median trade is flat to negative. The positive means come from a handful of large winners, not a broad edge. **That is the argument for the desk, not against it** — if the average disclosed purchase is noise, the value has to come from selection.

Every limit is code, not a prompt

- **\$5,000** maximum per trade · **\$25,000** per day
- **Never >5%** of a contract's open interest; minimum OI 50
- **Spreads >20% wide are skipped** — a thesis you can't exit is worth nothing
- **Marketable limit orders only.** Never a market order on an option
- **Paper-only guard:** the desk refuses to start against a live endpoint

CAUGHT IN DEVELOPMENT

Order reconciliation began writing real broker statuses while every limit query still filtered on 'placed'. The daily cap and position limit **silently stopped binding**.

Found, fixed, and pinned with parametrised regression tests asserting that live statuses consume the caps and dead ones release them.

36 tests cover the deterministic machinery — sizing under caps, spread validation, the paper-only guard.

The model can argue for a trade. It cannot argue for a bigger one.

RUNNING NOW

Live, autonomous, and auditable

Positions and P&L stream from a real Alpaca paper account. `desk` `loop` runs unattended — scanning for filings, holding them when the market is closed rather than pricing into a session it hasn't seen, and handing the book to a review agent over **Alpaca's MCP server**.
